

Ionic liquids have become very popular in the last years, because of their unique properties, e.g. extremely low vapor pressure, wide electrochemical window, and promising selectivity/capacity. Therefore, they are discussed as "designer solvents" for the use in

- chemical reactions (e. g. biphasic reactions)
- as selective solvent for separation processes (extraction, absorption,)
- electrochemistry, etc.

For the development of new processes using ionic liquids besides the various pure component properties like

- viscosity
- density
- heat capacity
- heat of fusion
- melting point
- heat of transition
- thermal conductivity
- surface tension
- speed of sound
- electrical conductivity

in particular the knowledge of the phase equilibrium behavior as function of temperature, i. e.

- activity coefficients at infinite dilution
- vapor-liquid equilibria
- liquid-liquid equilibria (miscibility gaps)
- solid-liquid equilibria (melting points of mixtures)
- gas solubilities
- salt solubilities
- excess enthalpies
- excess heat capacities

with ionic liquids is required.

A few years ago nearly no data were available for systems with ionic liquids. But during the last years different research groups started to measure the required pure component properties and mixture data.

Published as well as unpublished data (private communications) are continuously stored in the Dortmund Data Bank (DDB). At the moment DDB contains pure component and mixture data for 3,000 ionic liquids:

Data Bank	Data Sets	Data Points
Activity coefficients at infinite dilution in ionic liquids	52,100	52,100
Vapor-liquid equilibria (binary and ternary VLE)	6,450	68,500
Gas solubilities (GLE)	2,000	9,950
Solid-liquid equilibria (SLE)	1,500	16,950
Liquid-liquid equilibria (LLE)	5,950	76,900
Excess enthalpies (HE)	380	6,100
Excess heat capacities (CPE)	650	8,900
Densities, volumes, excess volumes	5,150	57,550
Mixture viscosities	5,900	59,600
Mixture surface tensions	1,200	12,300
Mixture speed of sound	4,450	50,800
Electrical conductivity	3,100	36,200
...
Pure Component Properties	11,400	87,450
Total	108,300	606,850

For building the data bank for ionic liquids 6,680 publicly available sources (mainly scientific articles) have been evaluated. If the use of ionic liquids for a specific application is planned (e.g. as solvent for chemical reactions, selective entrainer for the various separation processes extraction, absorption or other applications) these data are extremely helpful. The PC version of the data bank for ionic liquids is available for 19,400 €*. For the efficient use of the data, we recommend the use of a software package which is available for 4,950 € for a PC version*. This software package allows the data retrieval using several search options (components, systems, literature), has graphical data representations, copy and print capabilities, and allows data export to PPDX and Aspen™ INP files.

With the help of the software package new components can be defined and experimental data added to the data bank. At the same time the required basic data for the compounds, such as

- name and formula
- CAS registry number
- Antoine constants with the range of validity
- critical data and acentric factor
- density
- van der Waals properties
- melting point and heat of fusion
- dipole moment, etc.

are delivered. But because of the negligible vapor pressure, Antoine constants, critical data and acentric factors are available only for a limited number of ionic liquids.
